**Nutritionist  
Naturopath**

## live blood analysis

One single drop of blood can reveal:

- nutritional deficiencies
- organ-system dysfunctions
- gut permeability and digestive health
- antioxidant levels and free radical load
- biochemical imbalances
- toxic overload
- and so much more . . .

The test is performed with a “live” sample of your blood (one drop) while you are present. View your sample on a monitor and have an explanation of the features immediately.

### Why Use Live Blood Screening?

Live Blood Analysis detects functional imbalances or “precursors” to disease (inflammation, sluggish immune surveillance, poor red cell structure, etc.) very early on.

A treatment can then be implemented to rectify the change, even before the onset of disease – **prevention is better than cure!**

*Live Blood Analysis shows the relationship between what you're eating and doing in your lifestyle and how it affects your blood, body, health and wellbeing!*
